

Scaler Academy — Program Handbook (2026)

This handbook describes the structure of the Software Development and System Design program. The program runs for 15 months of live, instructor-led classes delivered online on weekends and two weekday evenings.

Learning Outcomes

By the end of the program a learner can design and implement data structures and algorithms, build scalable backend systems, reason about distributed system trade-offs, and clear technical interviews at product companies.

Attendance and Certification

A verified certificate of completion is awarded to learners who maintain at least 80% attendance, clear every module assessment, and submit the capstone project. Attendance is tracked automatically from live-class join logs.

Module Breakdown

The curriculum is organised into six modules delivered over 15 months. The table below summarises the sequence.

Module	Weeks	Focus
		Foundations of Programming 1-6
		Language mastery, complex Data Structures & Algorithms

Capstone Project

The capstone is a graded, individual project built over the final eight weeks. Learners design and ship a production-style system, defend their architecture in a review, and receive written feedback. Passing the capstone is mandatory for both certification and placement eligibility.

Mentorship

Each learner is paired with an industry mentor for fortnightly one-on-one sessions covering progress, doubts, and interview readiness. Mentors are senior engineers from product companies.
